

Climate Change Policy

SECURE Waste Infrastructure Corp.

Climate Change – Our Commitment

Climate change is a global challenge, and we believe that every individual, organization, industry and government have a responsibility to transition toward a low carbon future, reducing greenhouse gas (GHG) emissions and addressing climate related risks. SECURE recognizes the role we must play and is committed to reducing our GHG emissions and help our partners in industry reduce the overall emissions associated with delivering energy to the world, so people and communities thrive.

Climate Policy

At SECURE, we understand that the reduction of GHG emissions is a global climate concern, and we have a part to play by reducing our own carbon footprint and by helping our partners in industry reduce their carbon footprint as well. We commit to addressing climate considerations in our overall business strategy, corporate development, risk management and business models. This includes actions required to align with the expectations of both governments and stakeholders that are evaluating reductions in emissions and the impact to global climate concerns and risks.

Climate Leadership

We are engaged at all levels of the organization to improve the energy efficiency of our current operations, and future capital investments by:

- Investing in new technologies that reduce fugitive emissions and reduce our own carbon footprint at our midstream processing facilities.
- Monitoring and evaluating fleet management systems for opportunities to reduce fuel consumption.
- Establishing an emissions baseline at each facility and empowering our employees to reduce facility emissions.
- Assessing opportunities to offset GHG emissions through meaningful engagement, discussion and partnerships with our local communities, Indigenous nations, various organizations, governments, contractors, employees and shareholders.
- Seeking economically effective solutions and integrating climate considerations for key processes and systems that help improve the energy efficiency across our operations.
- Reporting and monitoring emissions reductions and providing clear, transparent reporting on what is important to all stakeholders.

Challenging What's Possible to Reduce Industry's Carbon Footprint

We are dedicated to creating value for our customers by providing innovative midstream solutions that help reduce costs and emissions associated with delivering energy to the world, including:

- Strategically locating midstream infrastructure near customer production to reduce transportation requirements for hauling oil, waste and water for processing and disposal.
- Building oil and water pipelines that connect customer production to SECURE midstream processing facilities reducing the emissions associated with trucking.
- Consolidating volumes from multiple producers in fit for purpose facilities, reducing our customers capital requirements and the overall environmental impact of our operations.
- Ensuring the safety and reliability of the energy infrastructure SECURE operates by being a leader in environmental stewardship.
- Reducing our carbon intensity in half by 2030 and reaching net zero emissions by 2050.
- Offer solutions to our customers that help reduce the carbon intensity of their operations.
